#Lasso Logistic Regression Model

Meeting the assumptions of the logisitc model

1. Logistic regression assumes linearity of independent variables and log odds of the dependent variable. Although this analysis does not require the dependent and independent variables to be related linearly, it requires that the independent variables are linearly related to the log odds of the dependent variable.
2. Logistic regression requires there to be little or no multicollinearity among the independent variables. Meaning, that the independent variables should not be too highly correlated with each other.
3. Binary logistic regression requires the dependent variable to be binary (which is true no code needed)
4. Logistic regression requires the observations to be independent of each other. (which is true no code needed)
5. Logistic regression typically requires a large sample size. (which is true no code needed)
6. No Extreme Outliers

Addressing Assumption 6: No Extreme Outlier

```
check_outliers <- function(data, continuous_vars) {  
  outlier_results <- list()  
  
  for (var in continuous_vars) {  
    # Calculate summary statistics  
    var_data <- data[[var]]
